Distribution lines will be constructed to serve an irrigation well motor in accordance with Line Extension Policy C-1. The Wheat Belt line extension will end at the metering point. Wheat Belt requires customers to install a disconnect at the meter for all new irrigation services.

Should an irrigation well go dry, and the customer requests a line extension for the purpose of irrigating the same piece of land, a Line Extension Agreement must be executed in accordance with Policy C-1. If the new well has the same or smaller electrical demand as the previous well, there will be no additional revenue to Wheat Belt to offset the new line extension cost. Payment of non-justified costs must be paid up front, and a new contract for service will also be required.

If an irrigation customer decides a well will no longer be used but does not want the facilities removed, the District will temporarily disconnect service to this well if the customer requesting disconnect pays the monthly minimum charges as set forth in the Irrigation Schedule I-2.

Understanding that irrigation services need to be test operated on occasion, an irrigator may request that the demand charge, less \$2.00 per kW, associated with a well test, of two hours or less, be adjusted off that well account. A write-off during peak hours, of two hours or less, when also operated during off peak hours, may be considered with accompanying proof of repair (such as an invoice) by a third party. The timeframe will be confirmed by the month's kWh and demand meter reading.
